

Test report

Testing basics

- **Login page:**
 - It was able to add new users to the MySQL database. And can login users. I did found more user that were added in the slower the response time got.
- **Channels page:**
 - It is able to create new channels.
 - It can also join these channels which will lead the user to the feed page.
 - When the user click the go to search it will lead the user to the search page.
- **Feed page:**
 - In this page the user can make new post and they will only show it on those channels
 - The like and dislike button do work however it resets to 0 when you go back to the channel.
 - The user is able to comment on the post that have been made.
- **Search page:**
 - Back to Channels works and is able to go back to channels
 - The search input work but is not able to display
 - Same goes for search by string, author, user with the most post and search user will least posts

Load test

- In most cases I found more users add the slower the response time got. This was a big problem with Socket.io. As more request were made the longer the response time got.
